

## Screen calibration:

How to calibrate the screen after software update or disconnection of the power supply.

- The screen will be black with a colored spot in the top right corner, when the update is finished.
- Please remove the USB key.
- Press accurately on the colored spot.
- When this is done there will appear a new colored spot up in the top left corner.
- Press accurately on this spot and a new spot will appear in the bottom left corner.
- Press accurately on this and a new spot will appear in the bottom right corner.
- Press accurately on this and a new spot will appear in the middle of the screen.
- Press accurately on this and the start screen will appear on the screen.
- If the start screen does not appear, the process will start up again with a colored spot in the top right corner.
- Repeat the sequence again. This will occur if the spots have not been pressed accurately enough.
- If the start screen has not appeared after 10 attempts, then disconnect the power supply for at least 60 seconds. Then the controller will start up with the old software version.
